Customization made easy

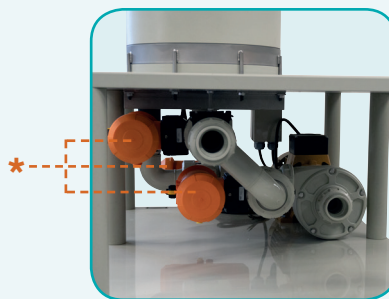

On rising requirements, some applications just require a purpose engineered device. With decades of experience in the design of pump and filtration systems, our engineering department creates customized specialties tailored to your demands. By using the modular components, we create value by incorporating standard and purpose engineered components to one integrated device. Resulting in the advantage of fast engineering and manufacturing creating a reliable and economic device, specially tailored to your needs, as per following examples.

MX160-72Z-P-PC-PP

Legislation didn't allow connection at the bottom of the tank. Therefore a reliable self-priming filter system for suction over the tank edge was required.

By incorporating a priming chamber the filter system was made self-priming.

MX260-152A-K-PP

A safe lock-out was required to ensure continuous agitation, also during filter cleaning.

The +GF+ pneumatic valves* are controlled from the central line panel and allow safe working conditions at filter cleaning. Further the valves close automatically in case of pressure loss, to by-pass the filter and maintain agitation. This prevents risk on rejection of products and being safe at the same time.

Above examples show well our customization capabilities. Should you have any specific demand, please feel free to contact us so we can jointly determine the best possible solution.
